NOTE: These slides contain *both* Sections 3.1 and 3.2.

3.1 Introduction to Determinants

McDonald Fall 2018, MATH 2210Q, 3.1&3.2 Slides

3.1 Homework: Read section and do the reading quiz. Start with practice problems.

• Hand in: 4, 8, 13, 20, 21, 37, 39.

• Recommended: 11, 31, 32.

Definition 3.1.1. For $n \geq 2$, let $A = [a_{ij}]$ be a $n \times n$ matrix. We define $A_{k\ell}$ to be the $(n-1) \times (n-1)$ matrix obtained by deleting the kth row and ℓ th column of A. We also set $\det(a) = a$ for any real number a. The **determinant** of A is the alternating sum

$$|A| = \det A = a_{11}A_{11} - a_{12}A_{12} + a_{13}A_{13} - a_{14}A_{14} + \dots + (-1)^{n+1} \det A_{1n}.$$

Remark 3.1.2. This is a *recursive* definition. That is, we need to know how to compute the determinants of the $A_{k\ell}$ first, before we can compute the determinant of A.

Example 3.1.3. Compute the determinant of
$$A = \begin{bmatrix} 1 & 2 & 0 \\ 2 & 3 & -2 \\ 0 & -3 & 0 \end{bmatrix}$$

$$\det A = \alpha_{1} / \det A_{11} - \alpha_{12} \det A_{12} + \alpha_{13} \det A_{13}$$

$$= 1 \cdot \begin{vmatrix} 3 - 2 \\ -3 0 \end{vmatrix} - 2 \cdot \begin{vmatrix} 2 - 2 \\ 0 0 \end{vmatrix} + 0 \begin{vmatrix} 2 & 3 \\ 0 - 3 \end{vmatrix}$$

$$= 1 \cdot (3 \cdot 0 - (-2)(-3)) - 2(2 \cdot 0 - (-2) \cdot 0)$$

$$= -6$$

Definition 3.1.4. Given $A = [a_{ij}]$, the (i, j)-cofactor of A is the number

$$C_{ij} = (-1)^{i+j} \det A_{ij}$$

Theorem 3.1.5. The determinant of an $n \times n$ matrix A can be computed by a **cofactor expansion** across any row or down any column. The expansion of across the ith row is

$$|A| = \det A = a_{i1}C_{i1} + a_{i2}C_{i2} + \dots + a_{in}C_{in}.$$

The cofactor expansion down the jth column is

$$|A| = \det A = a_{1j}C_{1j} + a_{2j}C_{2j} + \dots + a_{nj}C_{nj}.$$

Example 3.1.6. Use a cofactor expansion across the third row to compute det A where

$$A = \left[\begin{array}{rrr} 1 & 2 & 0 \\ 2 & 3 & -2 \\ 0 & -3 & 0 \end{array} \right]$$

across 3rd row

 $\det A = a_{31} \det A_{31} - a_{32} \det A_{32} + a_{33} \det A_{33}$ $= 0 \cdot \left(\frac{7}{3} - 2\right) - (-3) \left(\frac{1}{2} - 2\right) + 0 \cdot \left(\frac{7}{2} - 2\right)$ $= 3 \left(1 \cdot (-2) - 0 \cdot 2\right) = -6$

across 3'd column

 $\det A = \alpha_{13} \det A_{13} - \alpha_{23} \det A_{23} + \alpha_{33} \det A_{33}$ $= 0 \left| \frac{2}{0-3} \right| - (-2) \left| \frac{1}{0-3} \right| + 0 \cdot \left| \frac{1}{2} \frac{2}{3} \right|$ $= 2 \left(1 \cdot (-3) - 2 \cdot 0 \right) = -6$

Example 3.1.7. Compute the determinant of
$$A = \begin{bmatrix} 3 & 1 & -2 & 6 & 1 \\ 0 & 2 & 5 & -2 & 3 \\ 0 & 0 & 1 & 2 & 0 \\ 0 & 0 & 2 & 3 & -2 \\ 0 & 0 & 0 & -3 & 0 \end{bmatrix}$$

$$\begin{vmatrix} 1 & 2 & 6 & 1 \\ 0 & 1 & 2 & 0 \\ 0 & 0 & 2 & 3 & -2 \\ 0 & 0 & 3 & 3 & -2 \\ 0 & 0 & 2 & 3 & -2 \\ 0 & 0 & 2 & 3 & -2 \\ 0 & 0 & 3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 0 & 1 & 2 & 0 \\ 0 & 0 & 2 & 3 & -2 \\ 0 & 2 & 3 & -2 \\ 0 & 0 & 3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 0 & 0 & 2 & 3 & -2 \\ 0 & 2 & 3 & -2 \\ 0 & 0 & 3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 0 & 0 & 2 & 3 & -2 \\ 0 & 0 & 3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 0 & 0 & 2 & 3 & -2 \\ 0 & 0 & 3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 0 & 0 & 2 & 3 & -2 \\ 0 & 0 & 3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 2 & 3 & -2 & 2 \\ 0 & -3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 2 & 3 & -2 & 2 \\ 0 & -3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 2 & 3 & -2 & 2 \\ 0 & -3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 2 & 3 & -2 & 2 \\ 0 & -3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 2 & 3 & -2 & 2 \\ 0 & -3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 2 & 3 & -2 & 2 \\ 0 & -3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 2 & 3 & -2 & 2 \\ 0 & -3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 2 & 3 & -2 & 2 \\ 0 & -3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 2 & 3 & -2 & 2 \\ 0 & -3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 2 & 3 & -2 & 2 \\ 0 & -3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 2 & 3 & -2 & 2 \\ 0 & -3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 2 & 3 & -2 & 2 \\ 0 & -3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 2 & 3 & -2 & 2 \\ 0 & -3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 2 & 3 & -2 & 2 \\ 0 & -3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 2 & 3 & -2 & 2 \\ 0 & -3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 2 & 3 & -2 & 2 \\ 0 & -3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 2 & 3 & -2 & 2 \\ 0 & -3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 2 & 3 & -2 & 2 \\ 0 & -3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 2 & 3 & -2 & 2 \\ 0 & -3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 2 & 3 & -2 & 2 \\ 0 & -3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 2 & 3 & -2 & 2 \\ 0 & -3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 2 & 3 & -2 & 2 \\ 0 & -3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 2 & 3 & -2 & 2 \\ 0 & -3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 2 & 3 & -2 & 2 \\ 0 & -3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 2 & 3 & -2 & 2 \\ 0 & -3 & 0 \end{vmatrix} = 0 \cdot \begin{vmatrix} 1 & 2 & 6 & 1 \\ 2 & 3 & -2 & 2 \\ 0 & -3 &$$

motix was "easy" to compute ble

Theorem 3.1.8. If A is an $n \times n$ triangular matrix, then $\det A = a_{11}a_{22}a_{33}\cdots a_{nn}.$

Remark 3.1.9. This suggests a nice strategy. Turn A into a triangular matrix! We could try to reduce A to echelon form, U. How are determinants affected by row operations?

3.2 Properties of Determinants

3.2 Homework: Read section and do the reading quiz. Start with practice problems.

• *Hand in*: 8, 10, 16, 17, 20, 27, 34.

• Recommended: 2, 3, 26, 32, 40.

Theorem 3.2.1 (Row Operations). Let A be a square matrix.

(a) If a multiple of one row of A is added to another to produce B, then $\det B = \det A$.

(b) If two rows of A are interchanged to produce B, then $\det B = -\det A$.

(c) If one row of A is multiplied by k to produce B, then $\det B = k \det A$.

Example 3.2.2. Compute det A where
$$A = \begin{bmatrix} 1 & -4 & 2 \\ -2 & 8 & -9 \\ -1 & 7 & 0 \end{bmatrix}$$

Let's reduce before confuctor exp.

$$\det A = \begin{bmatrix} 1 & -4 & 2 \\ -2 & 8 & -9 \\ -1 & 7 & 0 \end{bmatrix} = \begin{bmatrix} 1 & -4 & 2 \\ 0 & -5 \\ 3 & 2 \end{bmatrix} = 1 \cdot \begin{bmatrix} 3 - 5 \\ 3 & 2 \end{bmatrix} - 0 \begin{bmatrix} -4 & 2 \\ 3 & 2 \end{bmatrix} + 0 \cdot \begin{bmatrix} -4 & 2 \\ 0 - 5 \end{bmatrix} = 1 \cdot (0 \cdot 2 - (-5) \cdot 3) = 15$$

$$4 \cot A = \begin{bmatrix} 1 & -4 & 2 \\ -1 & 7 & 0 \end{bmatrix} = \begin{bmatrix} 1 & -4 & 2 \\ 0 & 0 & -5 \end{bmatrix} = \begin{bmatrix} 1 & -4 & 2 \\ 0 & 3 & 2 \end{bmatrix} = \begin{bmatrix} 1 & -4 & 2 \\ 0$$

Example 3.2.3. Compute det
$$A$$
, where $A = \begin{bmatrix} 2 & -8 & 6 & 8 \\ 3 & -9 & 5 & 10 \\ -3 & 0 & 1 & -2 \\ 1 & -4 & 0 & 6 \end{bmatrix}$.

$$\det A = 2 \begin{vmatrix} 1 & -4 & 3 & 4 \\ 3 & -9 & 5 & -2 \\ -3 & 0 & 1 & -2 \\ 1 & -4 & 0 & 6 \end{vmatrix} = 2 \begin{vmatrix} 0 & 3 & -4 & -2 \\ 0 & -12 & 10 & 10 \\ 0 & 0 & -3 & 2 \end{vmatrix} = 2 \begin{vmatrix} 0 & 3 & -4 & -2 \\ 0 & 0 & -6 & 2 \\ 0 & 0 & 0 & 1 \end{vmatrix}$$

$$= 2 \begin{vmatrix} 1 & -4 & 3 & 4 \\ 0 & 3 & -4 & -2 \\ 0 & 0 & -6 & 2 \\ 0 & 0 & 0 & 1 \end{vmatrix}$$

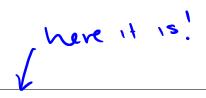

$$= 2 \cdot 1 \cdot 3 \cdot (-6) \cdot 1 = -36$$

Suppose an $n \times n$ matrix A can be reduced to echelon form U using only row replacements and row interchanges. Since U is in echelon form, it is triangular, so $\det U = u_{11}u_{22}u_{33}\cdots u_{nn}$.

Proposition 3.2.4. If an $n \times n$ matrix A can be reduced to echelon form U using only row replacements and k row interchanges, then

$$\det A = (-1)^k u_{11} u_{22} u_{33} \cdots u_{nn}.$$

general strat: bring to echelon turn, mult along diagonal computers take 2n3/3 ops 25425 take~16,000

Theorem 3.2.5. A square matrix A is invertible if and only if $\det A \neq 0$.

Example 3.2.6. Compute det A, where
$$A = \begin{bmatrix} 3 & -1 & 2 & -5 \\ 0 & 5 & -3 & -6 \\ -6 & 7 & -7 & 4 \\ -5 & -8 & 0 & 9 \end{bmatrix}$$

det $A = \begin{bmatrix} 3 & -1 & 2 & -5 \\ 0 & 5 & -3 & -6 \\ -6 & 7 & -7 & 4 \\ -5 & -8 & 0 & 9 \end{bmatrix}$
 $A = \begin{bmatrix} 3 & -1 & 2 & -5 \\ 0 & 5 & -3 & -6 \\ -6 & 7 & -7 & 4 \\ -5 & -8 & 0 & 9 \end{bmatrix}$
 $A = \begin{bmatrix} 3 & -1 & 2 & -5 \\ 0 & 5 & -3 & -6 \\ -6 & 7 & -7 & 4 \\ -5 & -8 & 0 & 9 \end{bmatrix}$
 $A = \begin{bmatrix} 3 & -1 & 2 & -5 \\ 0 & 5 & -3 & -6 \\ -6 & 7 & -7 & 4 \\ -5 & -8 & 0 & 9 \end{bmatrix}$
 $A = \begin{bmatrix} 3 & -1 & 2 & -5 \\ 0 & 5 & -3 & -6 \\ -5 & -8 & 0 & 9 \end{bmatrix}$
 $A = \begin{bmatrix} 3 & -1 & 2 & -5 \\ 0 & 5 & -3 & -6 \\ -5 & -8 & 0 & 9 \end{bmatrix}$
 $A = \begin{bmatrix} 3 & -1 & 2 & -5 \\ 0 & 5 & -3 & -6 \\ -5 & -8 & 0 & 9 \end{bmatrix}$
 $A = \begin{bmatrix} 3 & -1 & 2 & -5 \\ 0 & 5 & -3 & -6 \\ -5 & -8 & 0 & 9 \end{bmatrix}$
 $A = \begin{bmatrix} 3 & -1 & 2 & -5 \\ 0 & 5 & -3 & -6 \\ -5 & -8 & 0 & 9 \end{bmatrix}$
 $A = \begin{bmatrix} 3 & -1 & 2 & -5 \\ 0 & 5 & -3 & -6 \\ -5 & -8 & 0 & 9 \end{bmatrix}$
 $A = \begin{bmatrix} 3 & -1 & 2 & -5 \\ 0 & 5 & -3 & -6 \\ -5 & -8 & 0 & 9 \end{bmatrix}$
 $A = \begin{bmatrix} 3 & -1 & 2 & -5 \\ 0 & 5 & -3 & -6 \\ -5 & -8 & 0 & 9 \end{bmatrix}$
 $A = \begin{bmatrix} 3 & -1 & 2 & -5 \\ 0 & 5 & -3 & -6 \\ -6 & 7 & -7 & 4 \\ -5 & -8 & 0 & 9 \end{bmatrix}$
 $A = \begin{bmatrix} 3 & -1 & 2 & -5 \\ 0 & 5 & -3 & -6 \\ -6 & 7 & -7 & 4 \\ -5 & -8 & 0 & 9 \end{bmatrix}$
 $A = \begin{bmatrix} 3 & -1 & 2 & -5 \\ 0 & 5 & -3 & -6 \\ -6 & 7 & -7 & 4 \\ -5 & -8 & 0 & 9 \end{bmatrix}$
 $A = \begin{bmatrix} 3 & -1 & 2 & -5 \\ 0 & 5 & -3 & -6 \\ -6 & 7 & -7 & 4 \\ -5 & -8 & 0 & 9 \end{bmatrix}$
 $A = \begin{bmatrix} 3 & -1 & 2 & -5 \\ 0 & 5 & -3 & -6 \\ -6 & 7 & -7 & 4 \\ -5 & -8 & 0 & 9 \end{bmatrix}$

Example 3.2.7. Compute det A, where
$$A = \begin{bmatrix} 0 & 1 & 2 & -1 \\ 2 & 5 & -7 & 3 \\ 0 & 3 & 6 & 2 \\ -2 & -5 & 4 & -2 \end{bmatrix}$$

$$A = \begin{bmatrix} 0 & 1 & 2 & -1 \\ 2 & 5 & -7 & 3 \\ 0 & 3 & 6 & 2 \\ -2 & -5 & 4 & -2 \end{bmatrix} = \begin{bmatrix} 0 & 1 & 2 & -1 \\ 2 & 5 & -7 & 3 \\ 0 & 3 & 6 & 2 \\ -2 & -5 & 4 & -2 \end{bmatrix} = \begin{bmatrix} 1 & 2 & -1 \\ 2 & 5 & -7 & 3 \\ 0 & 3 & 6 & 2 \\ 0 & 3 & 6 & 2 \\ 0 & -3 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 2 & -1 \\ 2 & 5 & -7 & 3 \\ 0 & 3 & 6 & 2 \\ 0 & -3 & 1 \end{bmatrix}$$

$$= -\left(-2 \cdot \begin{bmatrix} 1 & 2 & -1 \\ 0 & -3 & 1 \\ 0 & 0 & 5 \end{bmatrix}\right)$$

Swap

$$= -2 \cdot \left[1 \cdot (-3) \cdot 5 \right] = -30$$

Theorem 3.2.8. If A and B are $n \times n$ matrices, then $\det AB = (\det A)(\det B)$.

Example 3.2.9. Verify Theorem 3.2.8 for
$$A = \begin{bmatrix} 1 & 0 \\ 2 & 5 \end{bmatrix}$$
 and $B = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$.

$$\det A = 5.1 - 0.2 = 5$$

$$\det B = 4.1 - 2.3 = -2$$

$$(\det A)(\det B) = 5.(-2) = -10$$

$$AB = \begin{bmatrix} 1 & 0 \\ 2 & 5 \end{bmatrix} \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} = \begin{bmatrix} 1 & 2 \\ 2+15 & 4+20 \end{bmatrix} = \begin{bmatrix} 1 & 2 \\ 13 & 24 \end{bmatrix}$$

$$\det(AB) = \begin{bmatrix} 1 & 2 \\ 13 & 24 \end{bmatrix} = 24 - 34 = -10$$

Example 3.2.10. Let A and P be square matrices with P invertible, and show that $\det(PAP^{-1}) = \det A$.

Theorem 3.2.11. If A is an $n \times n$ matrix, then $\det A^T = \det A$.

Remark 3.2.12. This means we can perform operations on the *columns* of a matrix in the same way that we perform row operations, and expect the same effect on the determinant.

Example 3.2.13. Compute det A, where $A = \begin{bmatrix} -5 & 2 & 2 & 2 \\ 3 & 0 & 3 & 5 \\ -4 & 0 & 4 & 0 \\ -2 & 0 & 2 & -2 \end{bmatrix}$.

 $\det A = \begin{bmatrix} -5 & 2 & 2 & 2 \\ 3 & 0 & 3 & 5 \\ -4 & 0 & 4 & 0 \\ -2 & 0 & 2 & -2 \end{bmatrix} = \begin{bmatrix} -5 & 2 & 2 & 2 \\ 6 & 0 & 3 & 5 \\ 0 & 0 & 4 & 0 \\ 0 & 0 & 2 & -2 \end{bmatrix} = \begin{bmatrix} -5 & 2 & 4 & 2 \\ 6 & 0 & 8 & 5 \\ 0 & 0 & 4 & 0 \\ 0 & 0 & 0 & -2 \end{bmatrix}$

 $= -\begin{vmatrix} 2 & -5 & 4 & 2 \\ 0 & 6 & 8 & 5 \\ 0 & 0 & 4 & 0 \\ 0 & 0 & 0 & -2 \end{vmatrix} = -2.6.4.(-2)$

Theorem 3.2.14 ("Column" Operations). Let A be a square matrix.

- (a) If a multiple of one column of A is added to another to produce B, then $\det B = \det A$.
- (b) If two columns of A are interchanged to produce B, then $\det B = -\det A$.
- (c) If one column of A is multiplied by k to produce B, then $\det B = k \det A$.
